On passing a turbulent stream of mixtures of higher hydrocarbons with air or oxygen through a reactor under conditions insuring complete mixing of the intake mixture with the reacting mixture periodic flashes (pulsations) of cool flame are observed. Experimental data support the chemical nature of the phenomenon. Formation and the stability of cool flame pulsations are connected with high contents of unsaturated hydrocarbons in the mixture. The frequency of pulsations is not much affected by the type of fuel, its content in the (Chemistry--Physical, TT, v. f, no. 7) (over)
